

SAINT OTM (Open Threat Management)

See More. Respond Faster. Operate as One.

**Your threats are connected.
Your security operations should be too.**

Open Threat Management

Modern threats move across networks, endpoints, identities, cloud environments, and critical infrastructure. When your security tools operate independently, important context can get lost between them. SAINT OTM brings security operations together, giving your team greater visibility across your environment and a clearer understanding of where threats exist and what requires attention.

Instead of adding another disconnected tool to your security stack, SAINT OTM unifies critical capabilities within one platform architecture. Security data becomes more useful when your team can connect activity across systems, identify meaningful patterns, and prioritize response based on risk. You gain the context needed to move from isolated alerts to informed action.

More visibility should lead to better decisions, not more noise. SAINT OTM applies intelligent analytics, behavioral monitoring, threat modeling, and automation to help surface meaningful activity sooner. Your team can spend less time sorting through alerts and more time investigating threats, containing incidents, and protecting critical assets.

Bring your security operations into focus.

Complex environments can create blind spots, fragmented workflows, and unnecessary operational overhead. A unified approach helps your team see activity across distributed systems while improving coordination and response. With the right context in one place, you can reduce alert fatigue, accelerate investigations, prioritize exposures, and strengthen security operations without continually adding complexity.

Visibility Across Your Environment

- Networks
- Endpoints
- Users & Identities
- Cloud
- Hybrid Environments
- Critical Infrastructure
- Operational Technology
- Security Events
- Threat Activity
- Risk Exposure

SAINT OTM

Unify Visibility. Strengthen Response.

Turn Security Signals Into Actionable Intelligence.

Your security environment generates enormous amounts of data. The challenge is turning that information into decisions your team can act on. SAINT OTM connects security telemetry, analytics, behavioral intelligence, and automation to provide a more complete picture of activity across your environment. That context helps your team identify threats sooner, prioritize what matters, and respond with greater speed and confidence.

AI-Powered Security Automation

Intelligent security operations can help your team recognize patterns and respond to changing threats more efficiently. SAINT OTM combines machine learning and deep learning analytics with dynamic threat modeling, user and entity behavior analytics, continuous exposure management, and automated threat detection and containment. These capabilities work together to improve visibility while reducing the manual effort required to investigate and respond.

Reduce Operational Complexity

Disconnected tools can create gaps in visibility, slow response workflows, and increase the burden on your security team. SAINT OTM brings critical security capabilities into a unified architecture so information can work together. Your team gains a more connected view of threats, fewer operational blind spots, and better context for deciding what requires immediate action.

Security Operations Capabilities

Strengthen your existing security operations with capabilities spanning SIEM, SOAR, UEBA, XDR, EDR, NDR, and threat intelligence integration. SAINT OTM also supports cloud security posture management, identity threat detection and response, attack surface management, threat hunting, behavioral analytics, automated incident response workflows, and multi-framework compliance management.

Why SAINT OTM

Your team should not have to piece together the full threat picture across disconnected systems. SAINT OTM brings visibility, intelligence, and response capabilities together so you can see threats in context and act sooner. Reduce operational friction, prioritize exposures based on impact, and give your security team the insight it needs to protect the assets that matter most.

Integrated Security Modules

- ✓ **aiXDR** – Correlate activity across endpoints, networks, cloud systems, and identities
- ✓ **aiSIEM** – Centralize security events, analytics, behavioral monitoring, and alert prioritization
- ✓ **aiSecOT360** – Gain visibility across operational technology and connected infrastructure
- ✓ **aiCompliance** – Continuously monitor compliance across major security and regulatory frameworks
- ✓ **aiSecurityBI360** – Transform complex security telemetry into actionable business intelligence
